5

CLAIMS

- Method for concentrating particles
 (100), including the following steps:
 - a) placement of said particles close to and / or on at least one waveguide (108) of a support (104),
 - b) injection of light radiation R into the said waveguide, injection causing grouping of particles into one or several clusters on the guide,
- 10 c) concentration or blocking of particles into one or several stationary clusters.
- Method for concentrating particles, in which said support comprises several waveguides, step
 b) leading to the formation of several clusters distributed on one or several of said waveguides.
- 3. Method for concentrating particles, according to either claim 1 or 2, in which said light 20 radiation R forms one or more stationary waves, to concentrate particles in several stationary clusters (202, 204, 206) on the same waveguide (108).
- 4. Method according to claim 3, the 25 stationary waves being produced through at least one diffraction grating (200).
 - 5. Method according to claim 3, in which the waveguide forms at least one optical loop (210),

20

the stationary waves being produced when the radiation passes through this optical loop.

- 6. Method according to claim 5, in which 5 waveguides join together at at least one concentration point (220), step b) leading to the formation of a single cluster located the concentration point.
- 7. Method according to claims 1 to 6, also including a step for marking particles before step a), in order to modify their optical index.
- 8. Method according to one of claims 1 to 15 7, the particles being cells or macromolecules or microballs.
 - 9. Method according to one of claims 1 to 8, the particles being glass balls and / or gold balls.
 - 10. Method according to one of claims 1 to 9, the inserted radiation being in a spectral range between the near ultraviolet and infrared.
- 11. Method according to claim 10, in which the radiation is in the range between the visible red and infrared.
- 12. Method according to one of claims 1 to 30 11, the particles being immersed in a liquid.

10

- 13. Method according to claim 12, the liquid being water.
- 14. Method according to one of claims 1 to 13, also including stopping injection of light 5 radiation as soon as a cluster is formed.
 - 15. Particle concentration device including one or several waveguides (108), the waveguides being surrounded on both sides by at least two diffraction gratings (212).
 - 16. Device according to claim 15, also including means (340, 330) for observing the particles and a portion of the waveguide(s) (108).
